### **Abstract**

Let  $(R, \mathbf{m})$  be a Noetherian local ring,  $\mathbf{a}$  an ideal of R and M a finitely generated Rmodule. We investigate some properties of formal local cohomology modules with respect to a Serre subcategory. We provide a common language to indicate some properties of formal local cohomology modules.

#### 1. Introduction

Throughout this paper  $(R, \mathbf{m})$  is a commutative Noetherian local ring,  $\mathbf{a}$  an ideal of R and M is a finitely generated R-module. For an integer  $i \in \mathbb{N}_0$ ,  $H_a^i(N)$  denotes the ith local cohomology module of M with respect to a as introduced by Grothendieck (cf. [1], [2].

We shall consider the family of local cohomology modules  $\{H_m^i\left(\frac{M}{a^nM}\right)\}_{n\in\mathbb{N}}$  for a non-negative integer  $i \in \mathbb{N}_0$ . With natural homomorphisms; this family forms an inverse system. Schenzel introduced the i-th formal local cohomology of M with respect to ain the form of  $f_a^i(M) \coloneqq \frac{\lim}{n \in \mathbb{N}} H_m^i\left(\frac{M}{a^n M}\right)$ , which is the *i-th* cohomology module of the **a**adic completion of the Čech complex  $\check{c}_x \otimes_R M$ , where  $\underline{x}$  denotes a system of elements of R such that  $Rad(\underline{x}, R) = m$  (see [3, Definition 3.1]). He defines the formal grade as  $f.grade(a, M) = \inf \{i \in \mathbb{N}_0 \mid f_a^i(M) \neq 0\}$ . For any ideal **a** of R and finitely generated *R*- module *M* the following statements hold:

(i) (See [3, Theorem 3.11]). If  $0 \to M' \to M \to M'' \to 0$  is a short exact sequence of finitely generated R- modules, then there is the following long exact sequence:

$$\cdots \to f_a^i(M') \to f_a^i(M) \to f_a^i(M'') \to \cdots$$

 $\cdots \to f_a^i(M') \to f_a^i(M) \to f_a^i(M'') \to \cdots$ . **Keywords:** Local cohomology, Formal local cohomology, Serre subcategory, Formal grade, Formal cohomological dimension.

Revised 18 Dec 2013

(ii) (See [3, Theorem 1.3]).  $f. grade(\mathbf{a}, M) \le \dim(M) - cd(\mathbf{a}, M)$ ; some properties of formal local cohomology have been presented in [3, 4, 5 and 6].

Throughout this paper S denotes a Serre subcategory of the category of R- modules and R – homomorphisms (we recall that a class S of R- modules is a Serre subcategory of the category of R- modules and R-homomorphisms if S is closed under taking submodules, quotients and extensions).

Our paper contains three sections. In Section 2, we shall define the formal grade of  $\boldsymbol{a}$  with respect to M in  $\mathcal{S}$  as the infimum of the integers i such that  $f_a^i(M) \notin \mathcal{S}$  and is denoted by  $f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . (See definition 2.1). Then we shall obtain some properties of this notion. We show that if  $\Gamma_a(M)$  is a pure submodule of M, then  $Hom_R(\frac{R}{m},f_a^t(\Gamma_a(M)))$  and  $Hom_R(\frac{R}{m},f_a^{t-1}(\frac{M}{\Gamma_a(M)}))$  belong to  $\mathcal{S}$  ,where  $t=f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ .

In Section 3, we shall define the formal cohomological dimension of  $\boldsymbol{a}$  with respect to M in S as the supremum of the integers i such that  $f_a^i(M) \notin S$  and is denoted by  $f.cd_S(\boldsymbol{a},M)$ . (See definition 3.1). The main result of this section is that if  $f_a^i(M) \in S$  and  $H_m^i(M) \in S$  for all i > t, then  $\frac{R}{a} \bigotimes_R f_a^t(M)$  belongs to S.

# 2. The formal grade of a module in a Serre subcategory

**Definition 2.1.** The formal grade of a with respect to M in S is the infimum of the integers i such that  $f_a^i(M) \notin S$  and is denoted by  $f.grade_S(a, M)$ .

**Proposition 2.2.** Let (R, m) be a local ring and a be an ideal of R. If  $0 \to L \to M \to N \to 0$  is an exact sequence of finitely generated R-modules, then the following statements hold.

- (a)  $f. grade_{\mathcal{S}}(\mathbf{a}, M) \ge \min\{f. grade_{\mathcal{S}}(\mathbf{a}, L), f. grade_{\mathcal{S}}(\mathbf{a}, N)\}$ .
- (b)  $f. grade_{\mathcal{S}}(\mathbf{a}, L) \ge \min\{f. grade_{\mathcal{S}}(\mathbf{a}, M), f. grade_{\mathcal{S}}(\mathbf{a}, N) + 1\}.$
- (c)  $f. grade_{\mathcal{S}}(\mathbf{a}, N) \ge \min\{f. grade_{\mathcal{S}}(\mathbf{a}, L) 1, f. grade_{\mathcal{S}}(\mathbf{a}, M)\}$

**Proof.** According to [3, Theorem 3.11], the above short exact sequence induces the following long exact sequence.

$$\cdots \to f_a^{i-1}(N) \to f_a^i(L) \to f_a^i(M) \to f_a^i(N) \to f_a^{i+1}(L) \to \cdots.$$

So, the result follows.

Downloaded from ndea10.khu.ac.ir on 2024-11-14]

**Corollary 2.3.** If  $\underline{x} = x_1, ..., x_n$  is a regular M-sequence, then  $f. grade_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{\underline{x}M}\right) \geq f. grade_{\mathcal{S}}\left(\boldsymbol{a}, M\right) - n$ .

**Proof.** Consider the following exact sequence  $(n \in \mathbb{N})$ 

$$0 \to \frac{M}{(x_1, \dots, x_{n-1})M} \xrightarrow{x_n} \frac{M}{(x_1, \dots, x_{n-1})M} \xrightarrow{nat.} \frac{M}{(x_1, \dots, x_n)M} \to 0$$

whenever n = 1 by  $(x_1, ..., x_{n-1})M$  we means 0.

Corollary 2.4. Let a and b be ideals of R. Then

- (a)  $f. grade_{\mathcal{S}}(\mathbf{a} \cap \mathbf{b}, M) \ge \min\{f. grade_{\mathcal{S}}(\mathbf{a}, M), f. grade_{\mathcal{S}}(\mathbf{b}, M), f. grade_{\mathcal{S}}((\mathbf{a}, \mathbf{b}), M) + 1\}\}$
- (b)  $f. grade_{\mathcal{S}}((\boldsymbol{a}, \boldsymbol{b}), M) \ge \min\{f. grade_{\mathcal{S}}(\boldsymbol{a} \cap \boldsymbol{b}, M) 1, f. grade_{\mathcal{S}}(\boldsymbol{a}, M), f. grade_{\mathcal{S}}(\boldsymbol{b}, M)\}.$

**Proof.** For all  $n \in \mathbb{N}$  there is a short exact sequence as follows:

$$0 \to \frac{M}{\boldsymbol{a}^n M \cap \boldsymbol{b}^n M} \to \frac{M}{\boldsymbol{a}^n M} \oplus \frac{M}{\boldsymbol{b}^n M} \to \frac{M}{(\boldsymbol{a}^n, \boldsymbol{b}^n) M} \to 0.$$

By using [3,Theorem 5.1], the above exact sequence induces the following long exact sequence.

$$\cdots \to \frac{\lim}{n \in \mathbb{N}} H^{i}_{\boldsymbol{m}} \left( \frac{M}{(\boldsymbol{a} \cap \boldsymbol{b})^{n} M} \right) \to \frac{\lim}{n \in \mathbb{N}} H^{i}_{\boldsymbol{m}} \left( \frac{M}{\boldsymbol{a}^{n} M} \right) \bigoplus \frac{\lim}{n \in \mathbb{N}} H^{i}_{\boldsymbol{m}} \left( \frac{M}{\boldsymbol{b}^{n} M} \right) \to \frac{\lim}{n \in \mathbb{N}} H^{i}_{\boldsymbol{m}} \left( \frac{M}{(\boldsymbol{a}, \boldsymbol{b})^{n} M} \right) \to \cdots.$$

So by using an argument similar to that of Proposition 2.2, the result follows.

**Corollary 2.5.** Assume that M is a finitely generated R- module and  $N_1$  and  $N_2$  are submodules of M. Then considering the exact sequence  $0 \to \frac{M}{N_1 \cap N_2} \to \frac{$ 

$$\frac{M}{N_1} \oplus \frac{M}{N_2} \to \frac{M}{N_1 + N_2} \to 0$$
 we shall have

(a) 
$$f. grade_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{N_1 \cap N_2}\right) \ge \min\{f. grade_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{N_1}\right), f. grade_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{N_1}\right)\}$$

MN2, f.gradeS **a**, MN1+N2+1}.

(b) 
$$f. \operatorname{grade}_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{N_1 + N_2}\right) \geq \min\left\{f. \operatorname{grade}_{\mathcal{S}}\left(\frac{M}{N_1 \cap N_2}\right) - 1, f. \operatorname{grade}_{\mathcal{S}}\left(\boldsymbol{a}, \frac{M}{N_1}\right)\right\}$$

$$MN1, f. \operatorname{grade}_{\mathcal{S}}\boldsymbol{a}, MN2.$$

**Theorem 2.6.** Let  $\boldsymbol{a}$  be an ideal of a local ring  $(R, \boldsymbol{m})$ , M be a finitely generated R-module and L be a pure submodule of M. Then  $f.grade_{\mathcal{S}}(\boldsymbol{a},L) \geq f.grade_{\mathcal{S}}(\boldsymbol{a},M)$  where  $\mathcal{S}$  is a Serre subcategory of the category of R-modules and R-homomorphisms. In particular, inf  $\{i|H^i_{\boldsymbol{m}}(L) \notin \mathcal{S}\} \geq \inf\{i|H^i_{\boldsymbol{m}}(M) \notin \mathcal{S}\}$ .

**Proof.** Let L be a pure submodule of M. So  $\frac{L}{a^{n_L}} \to \frac{M}{a^{n_M}}$  is pure for each  $n \in \mathbb{N}$ . Now according to [8, Corollary 3.2 (a)],  $H^i_m\left(\frac{L}{a^{n_L}}\right) \to H^i_m\left(\frac{M}{a^{n_M}}\right)$  is injective. Since inverse limit is a left exact functor,  $f^i_a(L)$  is isomorphic to a submodule of  $f^i_a(M)$ . Consequently,  $f. \operatorname{grade}_{\mathcal{S}}(a, L) \geq f. \operatorname{grade}_{\mathcal{S}}(a, M)$ . If a = 0 then,  $f. \operatorname{grade}_{\mathcal{S}}(0, M) = \inf \{i | H^i_m(M) \notin \mathcal{S}\}$  and the result follows.

**Corollary 2.7.** If  $0 \to L \to M \to N \to 0$  is a pure exact sequence of finitely generated R-modules, then min  $\{f. grade_S(\boldsymbol{a}, L), f. grade_S(\boldsymbol{a}, N) + 1\} \ge f. grade_S(\boldsymbol{a}, M)$ .

**Proof.** Since L is a pure submodules of M, as a result of the previous theorem,  $f.grade_{\mathcal{S}}(\boldsymbol{a},L) \geq f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . Hence we must prove that  $f.grade_{\mathcal{S}}(\boldsymbol{a},N) + 1 \geq f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . We assume that  $i < f.grade_{\mathcal{S}}(\boldsymbol{a},M)$  and we show that  $i < f.grade_{\mathcal{S}}(\boldsymbol{a},N) + 1$ . Consider the following long exact sequence.

$$\cdots \to f_a^{i-1}(M) \to f_a^{i-1}(N) \to f_a^i(L) \to f_a^i(M) \to f_a^i(N) \to \cdots . \ (**)$$

If  $i < f. grade_{\mathcal{S}}(\boldsymbol{a}, M)$ , then  $f_a^0(M), f_a^1(M), ..., f_a^{i-1}(M), f_a^i(M) \in \mathcal{S}$ . On the other hand, since  $i < f. grade_{\mathcal{S}}(\boldsymbol{a}, M) \leq f. grade_{\mathcal{S}}(\boldsymbol{a}, L), f_a^0(L), ..., f_a^i(L) \in \mathcal{S}$ . Hence, it follows from (\*\*) that  $f_a^0(N), ..., f_a^{i-1}(N) \in \mathcal{S}$  and so  $i-1 < f. grade_{\mathcal{S}}(\boldsymbol{a}, N)$ .

**Theorem 2.8.** Let  $(R, \mathbf{m})$  be a local ring,  $\mathbf{a}$  be an ideal of R, S be a Serre subcategory of the category of R-modules and R\_homomorphisms and  $M \in S$  be a finitely generated R-module such that  $\Gamma_{\mathbf{a}}(M)$  is a pure submodule of M. Then  $Hom_R\left(\frac{R}{\mathbf{a}}, f_a^t(\Gamma_{\mathbf{a}}(M))\right) \in S$ , where  $t = f.grade_S(\mathbf{a}, M)$ .

**Proof.** Due to the previous theorem,  $f.grade_{\mathcal{S}}(\boldsymbol{a},\Gamma_{\boldsymbol{a}}(M)) \geq f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . If  $f.grade_{\mathcal{S}}(\boldsymbol{a},\Gamma_{\boldsymbol{a}}(M)) > f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ , then the result is obvious. Accordingly, we assume that  $f.grade_{\mathcal{S}}(\boldsymbol{a},\Gamma_{\boldsymbol{a}}(M)) = f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . We know that  $Supp(\Gamma_{\boldsymbol{a}}(M)) \subseteq Var(\boldsymbol{a})$ . By using [4, Lemma 2.3],  $f_{\boldsymbol{a}}^i(\Gamma_{\boldsymbol{a}}(M)) \cong H_{\boldsymbol{m}}^i(\Gamma_{\boldsymbol{a}}(M))$  for all  $i \geq 0$ . So, if  $j < f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ , then  $f_{\boldsymbol{a}}^j(\Gamma_{\boldsymbol{a}}(M)) \cong H_{\boldsymbol{m}}^j(\Gamma_{\boldsymbol{a}}(M)) \in \mathcal{S}$  and  $Ext_R^k(\frac{R}{m},H_{\boldsymbol{m}}^j(\Gamma_{\boldsymbol{a}}(M)) \in \mathcal{S}$  for all  $k \geq 0$  and  $j < f.grade_{\mathcal{S}}(\boldsymbol{a},M)$ . Moreover  $Ext_R^t(\frac{R}{m},\Gamma_{\boldsymbol{a}}(M)) \in \mathcal{S}$ , because  $\Gamma_{\boldsymbol{a}}(M) \in \mathcal{S}$ . Consequently, according to [7, Theorem 2.2],

$$Hom_R(\frac{R}{m}, H_m^t(\Gamma_a(M)) \in \mathcal{S}, \text{ where } t = f. grade_{\mathcal{S}}(a, M).$$

**Corollary 2.9** With the same notations as Theorem 2.8, let  $X \in \mathcal{S}$  be a submodule of  $f_a^t(\Gamma_a(M))$ , where  $t = f. grade_{\mathcal{S}}(a, M)$ . Then  $Hom_R(\frac{R}{m}, \frac{f_a^t(\Gamma_a(M))}{X}) \in \mathcal{S}$ .

**Proof.** Consider the long exact sequence:

 $Hom_R\left(\frac{R}{m}, f_a^t\left(\Gamma_a(M)\right)\right) \to Hom_R\left(\frac{R}{m}, \frac{f_a^t\left(\Gamma_a(M)\right)}{X}\right) \to Ext_R^1\left(\frac{R}{m}, X\right).$  (\*)

In accordance with the previous theorem  $Hom_R(\frac{R}{m}, f_a^t(\Gamma_a(M))) \in \mathcal{S}$ . Moreover  $Ext_R^1(\frac{R}{m}, X) \in \mathcal{S}$ . It follows from the exact sequence (\*) that  $Hom_R(\frac{R}{m}, \frac{f_a^t(\Gamma_a(M))}{X}) \in \mathcal{S}$ .

**Theorem 2.10.** Suppose that  $\boldsymbol{a}$  is an ideal of  $(R, \boldsymbol{m})$  and  $M \in \mathcal{S}$  is a finitely generated R-module such that  $\Gamma_{\boldsymbol{a}}(M)$  is a pure submodule of M. Then  $Hom_R\left(\frac{R}{\boldsymbol{m}}, f_{\boldsymbol{a}}^{t-1}\left(\frac{M}{\Gamma_{\boldsymbol{a}}(M)}\right)\right) \in \mathcal{S}$ , where  $t = f. \ grade_{\mathcal{S}}(\boldsymbol{a}, M)$ .

**Proof.** One has  $f.grade_{\mathcal{S}}(\boldsymbol{a}, \Gamma_{\boldsymbol{a}}(M)) \geq f.grade_{\mathcal{S}}(\boldsymbol{a}, M)$ , by Theorem 2.6. Now, the exact sequence  $0 \to \Gamma_{\boldsymbol{a}}(M) \to M \to \frac{M}{\Gamma_{\boldsymbol{a}}(M)} \to 0$  induces the following long exact sequence:

$$\cdots \xrightarrow{\alpha} f_a^{t-1}(\Gamma_a(M)) \xrightarrow{\beta} f_a^{t-1}(M) \xrightarrow{\gamma} f_a^{t-1}(\frac{M}{\Gamma_a(M)}) \xrightarrow{\xi} f_a^t(\Gamma_a(M)) \xrightarrow{\varphi} \cdots (*)$$

Using the exact sequence (\*), we obtain the short exact sequence  $0 \to \operatorname{Im}(\beta) \to f_a^{t-1}(M) \to \operatorname{Im}(\gamma) \to 0$ . Since  $f_a^{t-1}(M) \in \mathcal{S}$ ,  $\operatorname{Im}(\beta) \in \mathcal{S}$  and  $\operatorname{Im}(\gamma) \in \mathcal{S}$ . Furthermore, we have the exact sequence  $0 \to \operatorname{Im}(\xi) \to H_m^t(\Gamma_a(M)) \to \operatorname{Im}(\varphi) \to 0$  which induces the following long exact sequence:

$$0 \to Hom_R(\frac{R}{m}, Im(\xi)) \to Hom_R(\frac{R}{m}, H^t_m(\Gamma_a(M))) \to \cdots$$

Thus  $Hom_R(\frac{R}{m}, Im(\xi)) \in \mathcal{S}$ . Finally, by considering the short exact sequence  $0 \to Im(\gamma) \to f_a^{t-1}\left(\frac{M}{\Gamma_a(M)}\right) \to Im(\xi) \to 0$  we can conclude that  $Hom_R\left(\frac{R}{m}, f_a^{t-1}\left(\frac{M}{\Gamma_a(M)}\right)\right) \in \mathcal{S}$ .

**Theorem 2.11.** Suppose that R is complete with respect to the <u>a</u>-adic topology and  $M \in \mathcal{S}$  be a finitely generated R-module and t a positive integer such that  $f_a^i(M) \in \mathcal{S}$  for all i < t. Then  $Hom_R\left(\frac{R}{m}, f_a^t(M)\right) \in \mathcal{S}$ .

**Proof.**We use induction on t. Let t=0. Consider the following isomorphisms.

$$Hom_{R}(\frac{R}{\underline{m}}, f_{\underline{a}}^{0}(M)) \cong \lim_{\stackrel{\longleftarrow}{n \in \mathbb{N}}} Hom_{R}(\frac{R}{\underline{m}}, H_{\underline{m}}^{0}(\frac{M}{\underline{a}^{n}M})) \cong \lim_{\stackrel{\longleftarrow}{n \in \mathbb{N}}} Hom_{R}(\frac{R}{\underline{m}}, \frac{M}{\underline{a}^{n}M})$$

$$\cong Hom_{R}(\frac{R}{\underline{m}}, \lim_{\stackrel{\longleftarrow}{n \in \mathbb{N}}} (\frac{M}{\underline{a}^{n}M})) \cong Hom_{R}(\frac{R}{\underline{m}}, \hat{M}^{\underline{a}}) \cong Hom_{R}(\frac{R}{\underline{m}}, M)$$

It is clear that  $Hom_R(\frac{R}{\underline{m}},M)\in S$ . So by the above isomorphisms, we deduce that  $Hom_R(\frac{R}{\underline{m}},f_{\underline{a}}^{\,0}(M))\in S$ .

Suppose that t>0 and the result is true for all integer i less than t. Set  $N:=\Gamma_{\mathbf{m}}(M)$ . Then  $f_a^i(M)\cong f_a^i\left(\frac{M}{N}\right)$  for all i>0, and so we may assume that  $depth_R(M)>0$ . There is an M-regular element  $x\in \mathbf{m}$ . The exact sequence  $0\to M\xrightarrow{x} M\to \frac{M}{xM}\to 0$  induces the following long exact sequence:

$$\cdots \to f_a^{t-2}(M) \xrightarrow{x} f_a^{t-2}(M) \xrightarrow{f} f_a^{t-2}\left(\frac{M}{xM}\right)$$

$$\to f_a^{t-1}(M) \xrightarrow{x} f_a^{t-1}(M) \xrightarrow{g} f_a^{t-1}\left(\frac{M}{xM}\right)$$

$$\to f_a^t(M) \xrightarrow{x} f_a^t(M) \xrightarrow{h} \cdots (*)$$

Using the exact sequence (\*) we obtain the short exact sequence

$$0 \to \frac{f_a^{t-1}(M)}{xf_a^{t-1}(M)} \to f_a^{t-1}\left(\frac{M}{xM}\right) \to \left(0:x\atop f_a^{t}(M)\right) \to 0.$$

Now, this exact sequence induces the following long exact sequence:

$$0 \to Hom_{R}\left(\frac{R}{m}, \frac{f_{a}^{t-1}(M)}{xf_{a}^{t-1}(M)}\right) \to Hom_{R}\left(\frac{R}{m}, f_{a}^{t-1}\left(\frac{M}{xM}\right)\right) \to Hom_{R}\left(\frac{R}{m}, \left(0:x\right)\right) \to Ext_{R}^{1}\left(\frac{R}{m}, \frac{f_{a}^{t-1}(M)}{xf_{a}^{t-1}(M)}\right) \to \cdots . (**)$$

By using (\*),  $f_a^i\left(\frac{M}{xM}\right) \in \mathcal{S}$  for all i < t-1. Therefore by the induction hypothesis  $Hom_R\left(\frac{R}{m}, f_a^{t-1}\left(\frac{M}{xM}\right)\right) \in \mathcal{S}$ . Furthermore  $Ext_R^1\left(\frac{R}{m}, \frac{f_a^{t-1}(M)}{xf_a^{t-1}(M)}\right) \in \mathcal{S}$  because  $f_a^{t-1}(M) \in \mathcal{S}$ . Thus in accordance with (\*\*),  $Hom_R\left(\frac{R}{m}, (0:x)\right) \in \mathcal{S}$ . Since  $x \in m$  according to [9,10.86] we have the following isomorphisms.

$$Hom_{R}\left(\frac{R}{m}, (0:x)\right) \cong Hom_{R}\left(\frac{R}{m}, Hom_{R}\left(\frac{R}{xR}, f_{a}^{t}(M)\right)\right) \cong Hom_{R}\left(\frac{R}{m} \otimes_{R} \frac{R}{xR}, f_{a}^{t}(M)\right) \cong Hom_{R}\left(\frac{R}{m}, f_{a}^{t}(M)\right).$$

Consequently  $Hom_R\left(\frac{R}{m}, f_a^t(M)\right) \in \mathcal{S}$ .

## 3. The formal cohomological dimension in a Serre subcategory

We recall from [3,Theorem 1.1] that for a finitely generated R-module M,  $\sup\{i \in \mathbb{N}_0 \mid f_a^i(M) \neq 0\} = \dim\left(\frac{M}{aM}\right)$ .

**Definition 3.1.** The formal cohomological dimension of M with respect to  $\underline{a}$  in S is The supremum of the integers i such that  $f_a^i(M) \notin S$  and is denoted by  $f \cdot cd_S(a, M)$ .

**Theorem 3.2.** Suppose that S is a Serre subcategory of the category of R- modules and R – homomorphisms and L and N are two finitely generated R- modules such that  $Supp_R(L) \subseteq Supp_R(N)$ . Then  $f \cdot cd_S(\boldsymbol{a}, L) \leq f \cdot cd_S(\boldsymbol{a}, N)$ .

**Proof.** It is enough to prove that  $f_a^i(L) \in \mathcal{S}$  for all  $i > f.cd_{\mathcal{S}}(\boldsymbol{a},N)$  and all finitely generated R- module L such that  $Supp_R(L) \subseteq Supp_R(N)$ . We use descending induction on i.For all  $i > \dim(\frac{L}{aL}) + f.cd_{\mathcal{S}}(\boldsymbol{a},N)$ ,  $f_a^i(L) = 0 \in \mathcal{S}$ . Let  $i > f.cd_{\mathcal{S}}(\boldsymbol{a},N)$  and the result is proved for i + l. By Gruson's theorem, there is a chain  $0 = L_0 \subset L_l \subset \cdots \subset L_l = L$  of submodules of L such that  $\frac{L_i}{L_{i-1}}$  is a homomorfic image of a direct sum of finitely many copies of N. Consider the exact sequence  $0 \to L_{i-1} \to L_i \to \frac{L_i}{L_{i-1}} \to 0$  (i = 0, l, ..., l). We may assume that l = l. The exact sequence  $0 \to K \to \bigoplus_{j=1}^t N \to L \to 0$  where K is a finitely generated R- module iduces the following long exact sequence:

$$\cdots \to f_a^i \bigl( \bigoplus_{j=1}^t N \bigr) \to f_a^i(L) \to f_a^{i+1}(K) \to \cdots . \, (*)$$

Based on the induction hypothesis  $f_a^{i+1}(K) \in \mathcal{S}$ . Moreover  $f_a^i(\bigoplus_{j=1}^t N) = \bigoplus_{j=1}^t f_a^i(N) \in \mathcal{S}$  for all i > f.  $cd_{\mathcal{S}}(a, N)$ . Hence it follows from the exact sequence (\*) that  $f_a^i(L) \in \mathcal{S}$ .

The next example shows that even if  $Supp_R(M) = Supp_R(N)$ , then it may not true that  $f.grade_S(\boldsymbol{a}, M) = f.grade_S(\boldsymbol{a}, N)$ .

Example 3.3. (See [4, Example 4.3 (i)]) Let  $(R, \mathbf{m})$  be a 2 dimensional complete regular local ring, S = 0 and  $\mathbf{a}$  be an ideal of R with  $\dim \left(\frac{R}{a}\right) = I$ . Then by using [5,Theorem 1.1],  $f.\operatorname{grade}_{S}(\mathbf{a},R) = 1$  and  $f.\operatorname{grade}_{S}\left(\mathbf{a},\frac{R}{\mathbf{m}}\right) = 0$ . Set  $M := R \oplus \frac{R}{\mathbf{m}}$ .

Then  $Supp_R(M) = Supp_R(R)$ . But

$$f. grade_{\mathcal{S}}(\boldsymbol{a}, M) = \inf \left\{ f. grade_{\mathcal{S}}(\boldsymbol{a}, R), f. grade_{\mathcal{S}}(\boldsymbol{a}, \frac{R}{m}) \right\} = 0.$$

**Corollary3.4.** For all  $x \in a$ ,  $f.cd_{\mathcal{S}}(a, M) \ge f.cd_{\mathcal{S}}(a, \frac{M}{xM})$ .

**Corollary3.5.** Suppose that  $0 \to L \to M \to N \to 0$  is an exact sequence of finitely generated R- modules. Then  $f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, M) = \max\{f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, L), f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, N)\}$ .

**Proof.** Since  $Supp_R(M) = Supp_R(L) \cup Supp_R(N)$  by referring to Theorem 3.2 we deduce that  $f.cd_{\mathcal{S}}(\boldsymbol{a}, M) \geq f.cd_{\mathcal{S}}(\boldsymbol{a}, L)$  and  $f.cd_{\mathcal{S}}(\boldsymbol{a}, M) \geq f.cd_{\mathcal{S}}(\boldsymbol{a}, N)$ . Therefore  $f.cd_{\mathcal{S}}(\boldsymbol{a}, M) \geq max \{f.cd_{\mathcal{S}}(\boldsymbol{a}, L), f.cd_{\mathcal{S}}(\boldsymbol{a}, N)\}$ .

Next we prove that  $max \{f. cd_S(\boldsymbol{a}, L), f. cd_S(\boldsymbol{a}, N)\} \geq f. cd_S(\boldsymbol{a}, M)$ .

Let  $i > max \{f. cd_{\mathcal{S}}(\boldsymbol{a}, L), f. cd_{\mathcal{S}}(\boldsymbol{a}, N)\}$ . Then  $f_a^i(N), f_a^i(L) \in \mathcal{S}$  and from the exact sequence  $f_a^i(L) \to f_a^i(M) \to f_a^i(N)$  we conclude that  $f_a^i(M) \in \mathcal{S}$ . Thus,

 $max\{f.cd_{\mathcal{S}}(\boldsymbol{a},L),f.cd_{\mathcal{S}}(\boldsymbol{a},N)\} \geq f.cd_{\mathcal{S}}(\boldsymbol{a},M).$ 

We recall that the cohomological dimension of an R-module M with respect to an ideal  $\alpha$  of R in S is defind as

$$cd_{\mathcal{S}}(\boldsymbol{a}, M) := \sup \{i \in \mathbb{N}_{0} | H_{\boldsymbol{a}}^{i}(M) \notin \mathcal{S} \}.$$

The following lemma shows that when we considering the Artinianness of  $f_a^i(M)$ , we can assume that M is a-torsion-free.

**Lemma 3.6.** Suppose that a is an ideal of a local ring (R, m) and t be a non-negative integer. If  $H_m^i(M) \in S$  for all  $i \ge t$ , then the following are equivalent:

(a) 
$$f_a^i(M) \in \mathcal{S} \text{ for all } i \geq t.$$

(b) 
$$f_a^i\left(\frac{M}{\Gamma_a(M)}\right) \in \mathcal{S} \text{ for all } i \geq t.$$

**Proof.** According to the hypothesis  $t > cd_{\mathcal{S}}(\boldsymbol{m}, M)$ . On the other hand  $Supp_{R}(\Gamma_{\boldsymbol{a}}(M)) \subseteq Supp_{R}(M)$ . So by referring to [7,Theorem 3.5],  $cd_{\mathcal{S}}(\boldsymbol{m}, \Gamma_{\boldsymbol{a}}(M)) \leq cd_{\mathcal{S}}(\boldsymbol{m}, M)$ . Thus,  $t > cd_{\mathcal{S}}(\boldsymbol{m}, \Gamma_{\boldsymbol{a}}(M))$  and  $H^{i}_{\boldsymbol{m}}(\Gamma_{\boldsymbol{a}}(M)) \in \mathcal{S}$  for all  $i \geq t$ . Now, consider the following long exact sequence:

$$\cdots \to f_a^i(\Gamma_a(M)) \to f_a^i(M) \to f_a^i(\frac{M}{\Gamma_a(M)}) \to f_a^{i+l}(\Gamma_a(M)) \to \cdots (*)$$

According to [4,Lemma 2.3]  $f_a^i(\Gamma_a(M)) \cong H_m^i(\Gamma_a(M))$ . By using the hypothesis  $f_a^i(\Gamma_a(M)) \in \mathcal{S}$  for all  $i \geq t$ . So it follows from the exact sequence (\*) that  $f_a^i(M) \in \mathcal{S}$  if and only if  $f_a^i(\frac{M}{\Gamma_a(M)}) \in \mathcal{S}$  for all  $i \geq t$ .

**Theorem 3.7.** Let  $(R, \mathbf{m})$  be a local ring and  $M \in \mathcal{S}$  be a finitely generated R- module of dimension d such that  $cd_{\mathcal{S}}(\mathbf{m}, M) \leq f. cd_{\mathcal{S}}(\mathbf{a}, M)$ . Then  $\frac{f_a^t(M)}{af_a^t(M)} \in \mathcal{S}$  where  $t = f. cd_{\mathcal{S}}(\mathbf{a}, M)$ .

**Proof.** We use induction on  $d = \dim(M)$ . If d = 0, then  $\dim\left(\frac{M}{aM}\right) = 0$ . Accordingly to [3, Theorem 1.1],  $f_a^i(M) = 0$  for all i > 0.

Moreover  $f_a^0(M) \cong M \in \mathcal{S}$ . By definition  $H_m^i(M) \in \mathcal{S}$  for all i > t. Therefore from the above lemma we can assume that M is a-torsion-free and there is an M-regular element  $x \in a$ . Consider the long exact sequence :

$$\cdots \to f_a^i(M) \xrightarrow{x} f_a^i(M) \xrightarrow{f} f_a^i\left(\frac{M}{xM}\right) \xrightarrow{g} f_a^{i+l}(M) \xrightarrow{h} \cdots (*)$$

By using the hypothesis  $f_a^i(M) \in \mathcal{S}$  for all i > t (because  $t = f.cd_{\mathcal{S}}(\boldsymbol{a}, M)$ ). So using the above long exact sequence  $f_a^i\left(\frac{M}{xM}\right) \in \mathcal{S}$  for all i > t. By induction hypothesis,  $f_a^t\left(\frac{M}{xM}\right) = C$ .

$$\frac{f_a^t\left(\frac{M}{xM}\right)}{af_a^t\left(\frac{M}{xM}\right)} \in \mathcal{S} \text{ because } \dim\left(\frac{M}{xM}\right) = \dim(M) - 1.$$

Afterwards from the exact sequence (\*) we get the following short exact sequence.

$$0 \to Im(f) \to f_a^t \left(\frac{M}{xM}\right) \to Im(g) \to 0$$

So we obtain the following long exact sequence.

... 
$$\rightarrow Tor_{I}^{R}\left(\frac{R}{a}, Im(g)\right) \rightarrow \frac{Im(f)}{aIm(f)} \rightarrow \frac{f_{a}^{t}\left(\frac{M}{xM}\right)}{af_{a}^{t}\left(\frac{M}{xM}\right)} \rightarrow \frac{Im(g)}{aIm(g)} \rightarrow 0.$$

Since  $f_a^t(M) \in \mathcal{S}$  and Im(g) is a submodule of  $f_a^{t+1}(M)$ , we deduce that  $Tor_l^R(\frac{R}{a}, Im(g)) \in \mathcal{S}$ . On the other hand,  $\frac{f_a^t(\frac{M}{xM})}{af_a^t(\frac{M}{xM})} \in \mathcal{S}$ . Therefore,  $\frac{Im(f)}{aIm(f)} \in \mathcal{S}$  by the

above long exact sequence.

Now, consider the following long exact sequence.

$$\frac{f_a^t(M)}{af_a^t(M)} \xrightarrow{x} \frac{f_a^t(M)}{af_a^t(M)} \to \frac{Im(f)}{aIm(f)} \to 0.$$

So, 
$$\frac{f_a^t(M)}{af_a^t(M)} \cong \frac{Im(f)}{aIm(f)}$$
 because  $x \in a$ . Consequently,  $\frac{f_a^t(M)}{af_a^t(M)} \in \mathcal{S}$ .

**Proposition 3.8.** For a finitely generated *R*-module *M*,

$$f.cd_{\mathcal{S}}(\boldsymbol{a}, M) = max \{f.cd_{\mathcal{S}}(\boldsymbol{a}, \frac{R}{P}) | P \in Ass_{R}(M) \}.$$

**Proof.** Set  $N := \bigoplus_{P \in Ass_R(M)} \frac{R}{P}$ . Then  $Supp_R(M) = Supp_R(N)$ . So, by Theorem 3.2 and Corollary 3.5,  $f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, M) = f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, N) = max \{ f \cdot cd_{\mathcal{S}}(\boldsymbol{a}, \frac{R}{P}) | P \in Ass_R(M) \}$ .

**Proposition 3.9.** Assume that  $\boldsymbol{a}$  is an ideal of the local ring  $(R, \boldsymbol{m})$ . Then  $Hom_R(\frac{R}{m}, f_a^0(M)) \in \mathcal{S}$  if and only if.  $Hom_R(\frac{R}{m}, \widehat{M}^a) \in \mathcal{S}$ .

**Proof.** It is enough to consider the following isomorphisms

$$\begin{split} Hom_{R}\left(\frac{R}{\boldsymbol{m}},f_{\boldsymbol{a}}^{\theta}(M)\right) &\cong \quad \lim_{n\in\mathbb{N}}Hom_{R}\left(\frac{R}{\boldsymbol{m}},H_{\boldsymbol{m}}^{\theta}\left(\frac{M}{\boldsymbol{a}^{n}M}\right)\right) \cong \quad \lim_{n\in\mathbb{N}}Hom_{R}\left(\frac{R}{\boldsymbol{m}},\frac{M}{\boldsymbol{a}^{n}M}\right) \\ &\cong \quad Hom_{R}\left(\frac{R}{\boldsymbol{m}},\frac{\lim_{n\in\mathbb{N}}\frac{M}{\boldsymbol{a}^{n}M}\right) \cong Hom_{R}\left(\frac{R}{\boldsymbol{m}},\widehat{M}^{\boldsymbol{a}}\right). \end{split}$$
